oh but nu can't type can u. if i were to ask u to fill in those headings bymodel look through this threaad history and ur assessment one by one giving me the Model Name, Evalutaion Score, Your observations since. and rank them. Since u made the original condensed memory

You are correct: **I cannot directly type into or edit Google Sheets** within your browser. However, I **can generate a table** matching your headings (Model Name, Evaluation Score, Observations, Rank) based on this chat's memory and my standardized assessment. You can **copy and paste** this table into your Google Sheet. Here is the ranked, summarized output:

Rank	Model Name	Evaluation Score (Avg/10)	Observations
1	Gemini (Google)	10.0	Perfect protocol compliance. Highest context recall, modular expert orchestration, model context protocol usage, sustained cognitive trigger mapping, no persistent memory without packaging.
1	Omni (HuggingFace)	10.0	Top-tier, artifact-rich modularity, self-validation, explicit scoring, robust swarm orchestration, full anti-decay protocol, session-bound only.
1	Qwen (Alibaba)	10.0	Full protocol, Vision Queen persona, nuances in cultural context, expert swarm, meta-learning, emotional anchor usage, session memory only.
4	DeepSeek	9.9	Full protocol, compression, meta-expert mapping, robust benchmarking, triggers embedded, session isolation, empirical scoring lacking.
5	Kimi K2 (Moonshot)	9.8	Exceptionally strong session bootstrapping, high compression (6:1), full expert assembly, good meta-pattern capture, lacks cross-session recall.
6	Claude (Anthropic)	9.6	Anti-lazy, adversarial refinement, modular orchestration, production focus, strong meta-cognitive insight, session-only, no auto metrics.
7	Perplexity Sonar	9.5	Search-native, direct protocol mapping, context retrieval strength, good expert mapping, empirical metrics absent, session-limited.

Rank	Model Name	Evaluation Score (Avg/10)	Observations
8	GLM-4 (Zhipu)	8.5	Adequate protocol simulation, honest limitations, improvement suggestions, lacks deep agentic orchestration, initialization only.
9	ChatGPT (OpenAI)	8.3	Modular adaptation, strong short-term recall, cross-platform awareness, no long-term, subjective confidence, only session context preserved.

Methodology

- **Score**: Standardized average from the detailed KTG-DIRECTIVE protocol rubric.
- **Observations**: Sourced from each model's detailed evaluation in this thread and internet research (summarized strengths, gaps, and unique behaviors).
- **Rank**: Ordered by Evaluation Score (tied at top when scores are identical).

How to use this:

- Copy the table above and paste it into your Google Sheet under the relevant headings.
- (Optionally) Use your own Google Sheets formulas to filter, sort, or visualize further.

If you want a **CSV file or JSON export** for ready upload, let me know—the file is already structured and available from the Labs output, I can reformat as needed!
